

# Training Data of DialEval-1 Task

---

Recently, many reserachers are trying to build automatic helpdesk systems. However, there are very few methods to evaluate such systems. In **DialEval-1**, we aim to explore methods to evaluate task-oriented, multi-round, textual dialogue systems automatically. This dataset have the following features:

- Chinese customer-helpdesk dialogues carwled from [Weibo](#).
- English dialgoues: manually translated from a subset of the Chinese dialgoues.
- Nugget type annotatoinis for each turn: indicate whether the current turn is useful to accomplish the task.
- Quality annotation for each dialogue.
  - task accomplishment
  - customer satisfaction
  - dialogue effectiveness

In DialEval-1, we consider annotations ground truth, and participants are required to predict nugget type for each turn (Nugget Detection, or ND) and dialogue quality for each dialogue (Dialogue Quality, or DQ).

## Registration

---

TO and register and obtain the dataset ,please send an email to [dialeval1org@list.waseda.jp](mailto:dialeval1org@list.waseda.jp) with the following information so that we can send you the training data.

- Team Name (e.g. Waseda)
- Principal investigator's name, affiliation, email address
- Names, affiliations, email addresses of other team members
- Subtasks that you plan to participate: Chinese, English, or BOTH

Later, NII will require you to register to NTCIR tasks through their website, but please contact us by email first

# Overview of Dataset

---

## Training Data

---

The Chinese training dataset contains 4,090 (3,700 for training + 390 for dev) customer-helpdesk dialogues which are crawled from [Weibo](#). All of these dialogues are annotated by 19 annotators.

The English dataset contains 2,251 dialogues for training + 390 for dev. They are manually translated from a subset of the Chinese dataset. The English dataset shares the same annotations with the Chinese dataset.

- Training set
  - train\_cn.json (3,700 Chinese dialogues)
  - train\_en.json (2,251 English dialogues)
- Dev set
  - dev\_cn.json (390 dialogues)
  - dev\_en.json (390 dialogues)

## Test Data

---

Will be released in Jun 2020 according to the task schedule.

## Annotation

---

We hired 19 Chinese students to annotate the training/dev dataset in 2018. In 2019, the test dataset of DialEval-1 were annotated by another group of annotators. Thus, there may be a gap between the training data and test data, as the dialogue annotation is quite subjective.

## Format of the JSON file

---

Each file is in JSON format with UTF-8 encoding.

Following are the top-level fields:

- **id**
- **turns**: array of turns from the customer and the helpdesk (see details below)
- **annotations**: a list of annotations provided by 19 annotators. Each annotation consists of two fields: **nugget** and **quality**

Each element of the turns field contains the following fields:

- **sender**: the speaker of this turn (either customer or helpdesk)
- **utterances**: the utterances (may be multiple) they sent in this turn. Note that some utterances are empty strings since we didn't crawl emoji and photos.

Each element of **annotations** contains the following fields:

- **nugget**: The list of nugget types for each turn (see details below).
- **quality**: A dictionary consists of the subjective dialogue quality scores: A-score, S-score, and E-score (see details below).

## Nugget Types

- CNUG0: Customer trigger (problem stated)
- CNUG\*: Customer goal (solution confirmed)
- HNUG\*: Helpdesk goal (solution stated)
- CNUG: Customer regular nugget
- HNUG: Helpdesk regular nugget
- CNaN: Customer Not-a-Nugget
- HNaN: Helpdesk Not-a-Nugget

## Nugget types: an example

C: I copied a picture from my PC to my mobile phone, but it kind of looks fuzzy on the phone. How can I solve this? P.S. I'm no good at computers and mobile phones.

CNUG0  
(problem  
stated)

H: Please synchronise your PC and phone using iTunes first, and then upload your picture.

HNUG\*  
(solution  
stated)

C: I'd done the synchronization but did not upload it with XXX Mobile Assistant. I managed to do so by following your advice. You are a real expert, thank you!

CNUG\*  
(solution  
confirmed)

H: You are very welcome. If you have any problems using XXX Mobile Phone Software, please contact us again, or visit XXX.com.

HNaN  
(Not-a-  
Nugget)

## Dialogue Quality

- A-score: Task **A**ccomplishment (Has the problem been solved? To what extent?)
- S-score: Customer **S**atisfaction of the dialogue (not of the product/service or the company)
- E-score: Dialogue **E**ffectiveness (Do the utterers interact effectively to solve the problem efficiently?)

Scale: [2, 1, 0, -1, -2]

# Evaluation

---

## Metrics

During the data annotation, we noticed that annotators' assessment on dialogues are highly subjective and are hard to consolidate them into one gold label. Thus, we proposed to preserve the diverse views in the annotations "as is" and leverage them at the step of evaluation measure calculation.

Instead of judging whether the estimated label is equal to the gold label, we compare the difference between the estimated distributions and the gold distributions calculated by 19 annotators' annotations). Specifically, we employ these metrics for quality sub-task and nugget sub-task:

- Quality:
  - **NMD**: Normalised Match Distance.
  - **RSNOD**: Root Symmetric Normalised Order-aware Divergence
- Nugget:
  - **RNSS**: Root Normalised Sum of Squared errors
  - **JSD**: Jensen-Shannon divergence

For the details about the metrics, please visit:
